Supplementary: Measured-data training (C=4)

C4 is selected per dataset only when polished phase MAE is lower and phase SSIM is higher than matched C1. C4 training used 10× oversampling: ten four-pattern groups per training center. C denotes grouped input/output channels. Synthetic-trained and LSQ-ML comparators are C1, so grouping and training source differ and the comparison does not isolate training source. Supplied reference is shown here; LSQ-ML100 is C1.
