

FRC vs. reference estimate (spatial validation); the high half selects checkpoints and is spatial validation, not an independent test. FRC50 describes agreement with the reference estimate. Grey x = Hybrid + patch offsets (C=1) with overlap constants before tilt refinement; this same-group ablation is not a previous-published CNN. Selected C1 group (Hybrid ResNet C=1) for this case; LSQ-ML100 uses the matched C1 reconstruction on the same frozen geometry. C4 timing unavailable; reserved-frame evidence unavailable; intermediate C4 stages are shown only for TP2 in the supplement. TP2 FRC excluded because of scan-grid artefacts; historical source values preserved.
